

ABSTRACT

The invention relates to a method of controlling a locking function in a locking arrangement. The method presented comprises creating (300) a database from predetermined objects; determining (302) at least one user-specific inter-object internal order in the database; detecting (304) a control command for starting the control of the locking function; displaying (306) a predetermined number of objects on the display of the locking arrangement once the control command is detected; detecting (308) the selection order of the objects; and changing (316) the lock state when the detected object selection order is at least sufficiently close to a given user-specific inter-object internal order.
